    <title>Computational Methods for Affect Detection from Natural Language</title>
    <description>A broad overview of natural language processing in affective computing is given by this title. Its goal is to familiarize the reader with current approaches in affective computing as well as the most relevant concepts related to this field (affect, sentiment, subjectivity and others). Research in human affect has a long established tradition in social sciences - Philosophy, Psychology, Socio-psychology, Cognitive Science, Pragmatics, Marketing, Communication. The study of affect from a computational point of view is a recent field in Artificial Intelligence, denominated "Affective Computing". Despite the novelty of the subject, the volume and importance of research in automatic human affect recognition, classification and simulation has been constantly growing in the past decades, leading to the development of further sub-areas of research. One of these directions deals with the study of automatic affect treatment from text, in the Artificial Intelligence area of Natural Language Processing. In this context, different tasks have been developed, from emotion detection, subjectivity analysis, opinion mining to sentiment analysis and appraisal analysis.</description>

Additional information

The concept of sustainability is gaining high interest from scholars and researchers in all areas including sustainable human resource management (SHRM). The adoption of SHRM practices allows organisations to become more efficient, productive and competitive while ensuring environmental, social and economic outcomes. The objective of this systematic literature review is to examine the state of SHRM by determining current trends and theoretical aspects. Consequently, this will allow a better understanding of SHRM and therefore help to establish gaps and future research agenda. Articles were selected based on the PRISMA framework and were analysed in depth to provide comprehensive review on SHRM and its emerging issues. The study integrates previous insights on the topic to provide a far-reaching theoretical analysis that highlights the trends, dimensions, characteristics, practices, outcomes and models and theories related to SHRM. The findings of the paper identify areas for future research to expand the theories of SHRM.

Altmetric calculates a score based on the online attention an article gets — the higher the score, the more online attention an article has received.

The donut visual summarises attention from different sources such as social media and news outlets. A breakdown is shown in the legend.

Older articles have had more time to get noticed, so Altmetric provides context data for articles of a similar age.

This article is in the 99th percentile (ranked 992nd) of the 226,385 tracked articles of a similar age in all journals and the 98th percentile (ranked 29th) of the 1,837 tracked articles of a similar age in *Nature Communications*.

Preoperative preparation, especially mechanical and/or antibiotic bowel preparation, is a routine procedure before colorectal examinations and surgeries. Bowel preparation aims to decrease bacterial load and stool burden and facilitates surgeries. With popularization of ERAS (Enhanced Recovery after Surgery), some have discontinued routine preoperative preparation; however, preparation is still vitally important in NOSES. It involves many aspects including bowel preparation, psychology preparation, and vaginal preparation for the female. Without preoperative preparation, outcomes may suffer.
